To what extent does difficulty with word spelling affect our ability to plan language in real time?

Where is the chicken?

Language planning is incremental and takes time!

Serial view: Speaker / writers pause at linguistic edges to plan upcoming information (Flower & Hayes, 1980; Hayes, 2012).

Language planning is incremental and takes time!

Serial view: Speaker / writers pause at linguistic edges to plan upcoming information (Flower & Hayes, 1980; Hayes, 2012).

Language planning is incremental and takes time!

Serial view: Speaker / writers pause at linguistic edges to plan upcoming information (Flower & Hayes, 1980; Hayes, 2012).

Language planning is incremental and takes time!

Parallel view: Planning unfolds concurrently to output (Olive, 2014; Roeser et al., 2025; Van Galen, 1991).

Pauses during production result from delays in information flow! Slow orthographic retrieval delays upstream processes.

Language planning is incremental and takes time!

Parallel view: Planning unfolds concurrently to output (Olive, 2014; Roeser et al., 2025; Van Galen, 1991).

Pauses during production result from delays in information flow! Slow orthographic retrieval delays upstream processes.

Language planning is incremental and takes time!

Parallel view: Planning unfolds concurrently to output (Olive, 2014; Roeser et al., 2025; Van Galen, 1991).

Pauses during production result from delays in information flow! Slow orthographic retrieval delays upstream processes.

Describe the arrangement from left to right!

Example screen (Roeser et al., [2019](#); Smith & Wheeldon, [1999](#))

Describe the arrangement from left to right!

Example screen (Roeser et al., [2019](#); Smith & Wheeldon, [1999](#))

Design: Example item set

N1: easy spelling / long

N1 difficult spelling / long

N1: easy spelling / short

Prediction: Typing hesitations for N2 (*clown*) result from (1) when N1 spelling (*broccoli*) couldn't be retrieved in time and (2) when N1 length (*wok*) didn't allow for parallel planning.

- ▶ 36 items counterbalanced for prime structure (simple, conjoined subject) and N1 word type.
- ▶ 24 fillers with structures different from items.
- ▶ N1 word type manipulation: easy spelling (long), easy spelling (short), difficult spelling (long):
 - ▶ Long: ≥ 2 syllables
 - ▶ Difficult: spelling diversity $H_{spell} > 0.5$

What is “spelling diversity”?

Write the name of what you see!

What is “spelling diversity”?

What is “spelling diversity”?

Example summary: 75 / 97 participants used some spelling of “raccoon”.

response	N_{spell}	Pr_{spell}	H_{spell}
raccoon	41	.55	1.31
racoon	30	.40	1.31
raccon	2	.03	1.31
raccoo	1	.01	1.31
racoo	1	.01	1.31

Note. H = diversity statistic; Pr = proportion of responses.

Frequency of a spelling used relative to the number different spellings:

$$H_{spell} = \sum_{i=1}^K p_i \times \log_2\left(\frac{1}{p_i}\right),$$

where k is the number of spellings for a picture name; p_i is the proportion of participants producing the i^{th} spelling (Lachman, 1973; Torrance et al., 2018).

What is “spelling diversity”?

... were extracted from inter-keystroke intervals using Bayesian mixed-effects mixture model (Roeser et al., 2024, 2025).

Tutorial:

<https://rpubs.com/jensroes/mixture-models-tutorial>.

Experiment 1

$N = 56$ participants; 6 counterbalancing lists

Experiment 1

$N = 56$ participants; 6 counterbalancing lists

Experiment 1

N = 56 participants; 6 counterbalancing lists

Experiment 1

$N = 56$ participants; 6 counterbalancing lists

Experiment 1

N = 56 participants; 6 counterbalancing lists

Experiment 1

$N = 56$ participants; 6 counterbalancing lists

Does typing and the buy writers enough time to avoid hesitations before N2?

Additional prime condition; two target structures:

- ▶ With N2 determiner: *The N1 and the N2 are above the N3*
- ▶ Without N2 determiner: *The N1 and N2 are above the N3*

Prediction: If short distance between nouns constraints parallel planning, we expect more hesitations before N2 when the was omitted.

Experiment 2

$N = 80$ participants; 9 counterbalancing lists

Experiment 2

$N = 80$ participants; 9 counterbalancing lists

Experiment 2

$N = 80$ participants; 9 counterbalancing lists

Experiment 2

$N = 80$ participants; 9 counterbalancing lists

Experiment 2

$N = 80$ participants; 9 counterbalancing lists

Experiment 2

N = 80 participants; 9 counterbalancing lists

Experiment 2

N = 80 participants; 9 counterbalancing lists

Experiment 3

Are hesitations related to delayed N2 retrieval?

Prime with (auditory) N2 preview:

- ▶ Previewed: *The N1 and clown are above the pipe*
- ▶ Not previewed: *The N1 and bow are above the pipe*

Target: *The N1 and clown are above the onion*

Prediction: If spelling difficulty delayed N2 retrieval, preview will reduce associated hesitations.

Experiment 3

N = 96 participants; 12 counterbalancing lists

Experiment 3

$N = 96$ participants; 12 counterbalancing lists

Experiment 3

N = 96 participants; 12 counterbalancing lists

Experiment 3

N = 96 participants; 12 counterbalancing lists

Experiment 3

N = 96 participants; 12 counterbalancing lists

- ▶ Written sentence planning unfolds in parallel to production: N1 spelling difficulty affects N2 retrieval.
- ▶ Difficulty with spelling creates a planning bottleneck with knock-on effects on higher level processes.
- ▶ Parallel planning is subject to time constraints (see also Griffin, 2003): hesitations occur when there was not enough time between N1 and N2 for parallel lexical retrieval of N2.
- ▶ Serial models of language planning cannot explain these results (Flower & Hayes, 1980; Hayes, 2012).

Spelling and naming diversity

N of pics: 383

Inter-keystroke intervals were analysed in mixture models with shifted-lognormal distributions (Roeser et al., [2024](#), [2025](#)).

$$(\log(iki_{ij}) - shift_i) \sim \theta_{condition} \times \mathcal{N}(\beta_{location} + \delta_{location} + u_i + w_j, \sigma_{e'}^2) + \\ (1 - \theta_{condition}) \times \mathcal{N}(\beta_{location} + u_i + w_j, \sigma_e^2)$$

where:

$$u_i \sim \mathcal{N}(0, \sigma_u^2)$$

$$w_j \sim \mathcal{N}(0, \sigma_w^2)$$

constraints:

$$\delta, \text{ (and all } \sigma\text{s)} > 0$$

$$\sigma_{e'}^2 > \sigma_e^2$$

θ returns the proportion of hesitant inter-keystroke intervals for each key-location, prime and N1 condition.

Most other mixture model parameter estimates

Experiment 1: determiner omissions before N2

Experiment 2: determiner omissions before N2

Experiment 3: determiner omissions before N2

Experiment 3: N2-initial hesitations
